

Perceptual Image Retrieval using Eye Movements

Oyewole Oyekoya

Problem Area

How can we make use of human visual behaviour to provide a fast and relevant search of an image database?

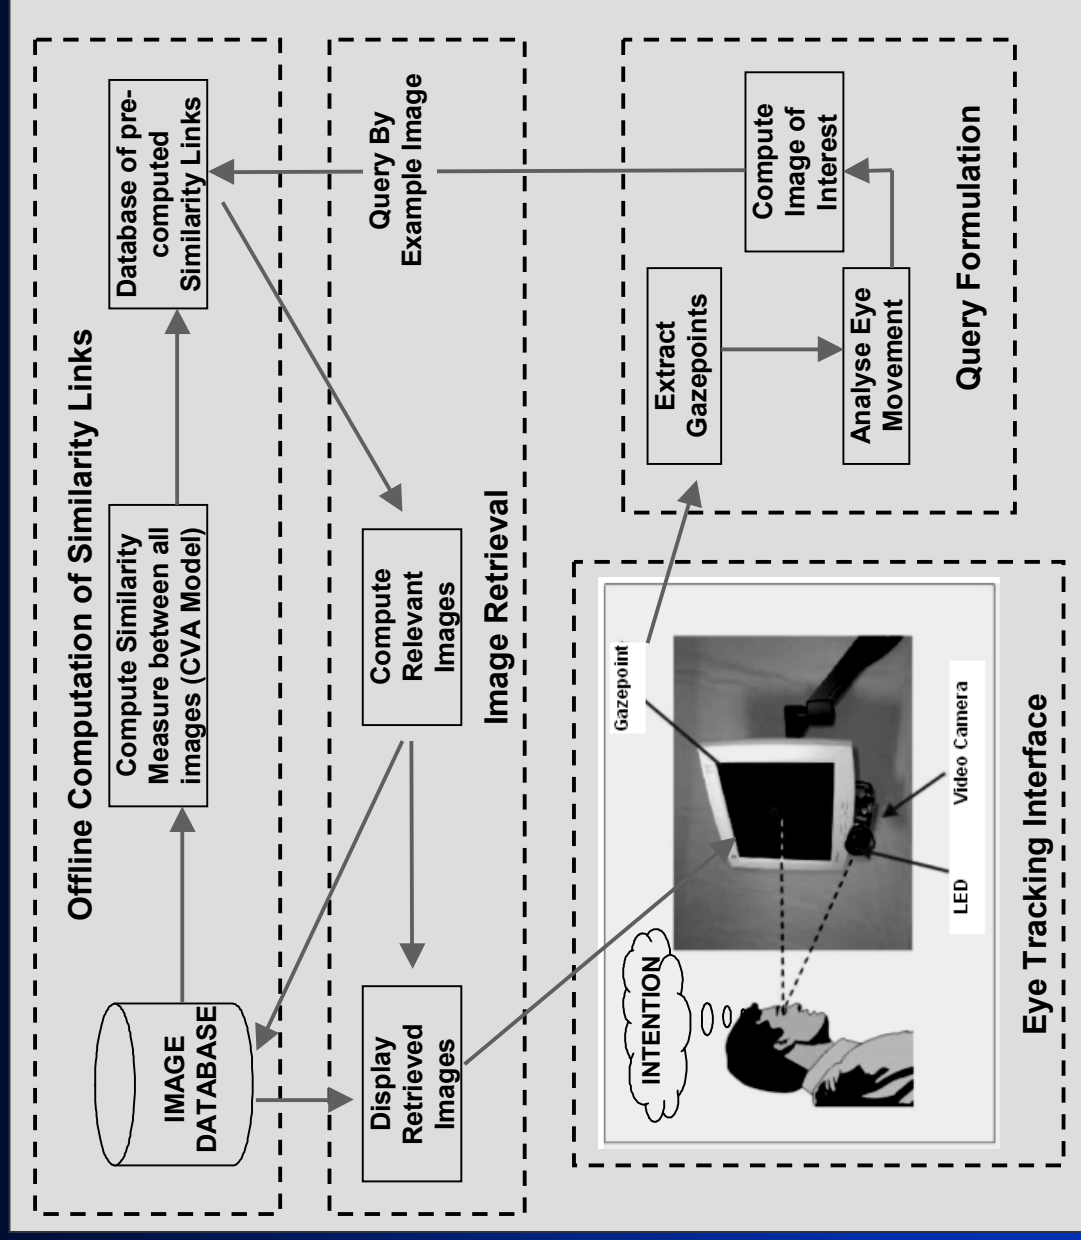

Problems with Information Searching

- Formulating a good query

Research Focus

- New Query Interfaces (Visual Input)

System Architecture

Search Task

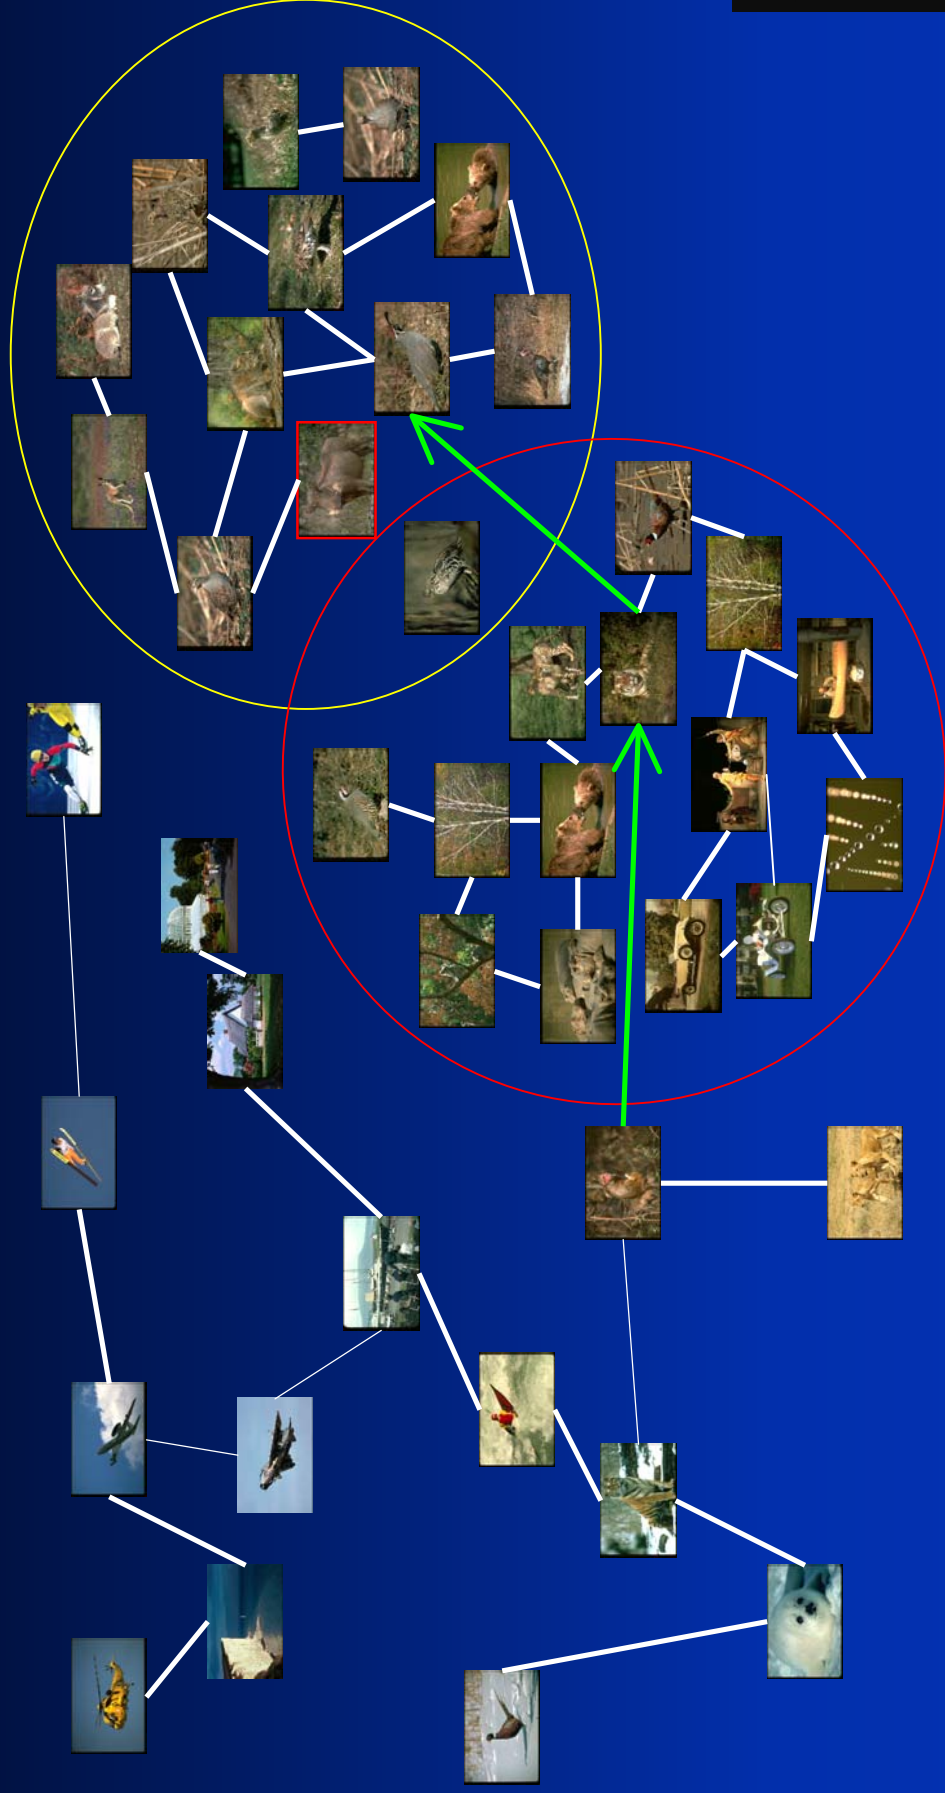

Steps to target

Time to target

Fixation Numbers

Representation of pre-computed similarity links

Experiment Design

- Database: 1000 images
- Selection factors
 - Fixation Threshold: 400ms and 800ms
 - Image Types: 4 Easy-to-find and 4 Hard-to-find images
 - Number of images retrieved randomly: none and one

Display Change

- Gaze selection of an image is determined by using the sum of all fixations of 80ms and above on an image position, up to a fixation threshold. The next set of images are then retrieved from the database and displayed for the next selection using a similarity model.

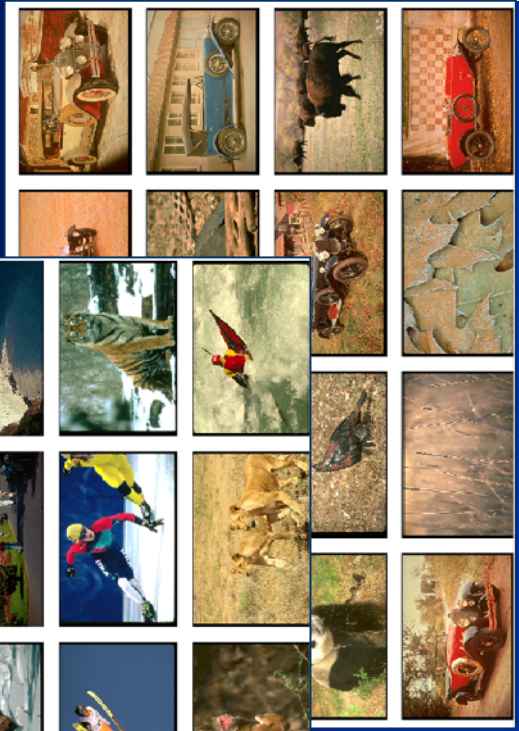

Video Replay?

Random Gaze Strategy

Steps to target

Results

- The participants using the eye tracking interface found the target in significantly fewer steps when compared with an automated random gaze strategy.
- Easy-to-find target images were found in fewer steps, fewer fixations and shorter time by participants than the hard-to-find images.

Results

- Setting a higher threshold did not have a significant effect when either 400ms or 800ms was used for the easy-to-find images, but it did for the hard-to-find images.
- Inclusion of one randomly retrieved image in each display made little or no difference in the steps to target, time to target and fixation numbers.

Recent Findings

- Refixation or revisit on an image may be an indication of interest in an image.
- Pre-attentive Vision: Participants were able to find target images on a 200ms fixation threshold.
- Saccade speeds may be frequently slower just before selection of an image.

Conclusion

- The eye tracking interface together with pre-computed similarity measures yield a significantly better performance than random selection using the same similarity information.
